IN THE CLAIMS:

1-4. (cancelled)

5. (currently amended) A method of making a low-pin-count chip package, said method comprising the steps of:

providing a sheet carrier;

laminating a metal layer on the sheet carrier;

half-etching the metal layer so as to form concavities <u>cavities</u> at predetermined positions thereof;

forming a photoresist layer on the half-etched metal layer;

half-removing the photoresist layer such that only the photoresist within the concavities cavities is left;

forming a metal coating on the surface of the <u>half-etched</u> metal layer which is not covered by the photoresist;

stripping the remaining photoresist within the concavities cavities;

etching the <u>half-etched</u> metal layer <u>using the metal coating as a mask</u> so as to form a plurality of connection pads having a substantially concave profile;

attaching a semiconductor chip onto the sheet carrier;

electrically coupling the semiconductor chip to the connection pads;

forming a package body over the semiconductor chip and the connection pads wherein the substantially concave profile helps to lock the connection pads in the package body;

removing the sheet carrier after the package body is formed; and

forming a protective metal flash on the lower surface of the connection pads exposed from the package body.

6. (original) The method as claimed in claim 5, wherein the protective metal flash comprises a layer of nickel covering the lower surface of the connection pads, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.

- 7. (original) The method as claimed in claim 5, wherein the sheet carrier is a polyimide tape with a layer of silicone adhesive.
- 8. (original) The method as claimed in claim 5, wherein the sheet carrier is a polyester tape with a layer of silicone adhesive.
- 9. (original) The method as claimed in claim 5, wherein the metal coating comprises a layer of nickel covering the surface of the metal layer which is not covered by the photoresist, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.

10-13. (cancelled)

14. *(currently amended)* A method of making a low-pin-count chip package, said method comprising the steps of:

providing a sheet carrier;

laminating a metal layer on the sheet carrier;

half-etching the metal layer so as to form concavities <u>cavities</u> at predetermined positions thereof;

forming a photoresist layer on the <u>half-etched</u> metal layer;

half-removing the photoresist layer such that only the photoresist within the concavities cavities is left;

forming a metal coating on the surface of the <u>half-etched</u> metal layer which is not covered by the photoresist;

stripping the remaining photoresist within the concavities cavities;

etching the <u>half-etched</u> metal layer <u>using the metal coating as a mask</u> so as to form a die pad and a plurality of connection pads having a substantially concave profile;

attaching a semiconductor chip onto the die pad;

electrically coupling the semiconductor chip to the connection pads;

Docket No.: 4459-014A

forming a package body over the semiconductor chip and the connection pads wherein the substantially concave profile helps to lock the connection pads in the package body;

removing the sheet carrier after the package body is formed; and

forming a protective metal flash on the lower surfaces of the die pad and the connection pads.

- 15. (original) The method as claimed in claim 14, wherein the protective metal flash comprises a layer of nickel covering the lower surfaces of the die pad and the connection pads, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.
- 16. (original) The method as claimed in claim 14, wherein the sheet carrier is a polyimide tape with a layer of silicone adhesive.
- 17. (original) The method as claimed in claim 14, wherein the sheet carrier is a polyester tape with a layer of silicone adhesive.
- 18. (original) The method as claimed in claim 14, wherein the metal coating comprises a layer of nickel covering the surface of the metal layer which is not covered by the photoresist, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.
- 19. *(new)* The method as claimed in claim 5, wherein said sheet carrier is completely removed in the step of removing the sheet carrier after the package body is formed.
- 20. (new) The method as claimed in claim 14, wherein said sheet carrier is completely removed in the step of removing the sheet carrier after the package body is formed.
